

In the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application.

Claims 1-7 (canceled)

8. (currently amended) A razor cleaning device comprising an elongated handle to which are attached a brush and at least one set of two or more parallel teeth of decreasing lengths, said set of teeth extending from a substantially planar surface of the handle of the device, such that the surface from which the teeth extend is laterally spaced from a longitudinal plane that bisects the handle of the device and extends along the length thereof, further wherein the parallel teeth are ~~such that when vertically aligned, relative to the longitudinal plane, having the longest tooth of at least one set will be at the top and the shortest tooth of the same set will be at the bottom.~~

9. (currently amended) The razor cleaning device, according to claim 8, wherein the at least two or more teeth project from the handle of the device, at an angle ~~such that the intersection of the teeth with the handle of the device form oblique angles of~~ from about 1° to about 90° relative to the longitudinal plane.

10. (currently amended) The razor cleaning device, according to claim 8, wherein the at least two or more teeth project from the handle forming an oblique angle of the device ~~such that the intersection of the teeth with the handle of the device form oblique angles of~~ from about 20° to about 70° relative to the longitudinal plane.

11. (currently amended) The razor cleaning device, according to claim 8, wherein the at least two or more teeth project from the handle forming an oblique angle of the device ~~such that the intersection of the teeth with the handle of the device form oblique angles of~~ from about 30° to about 60° relative to the longitudinal plane.

12. (currently amended) The razor cleaning device, according to claim 8, wherein the at least

two or more teeth project from the handle forming an oblique angle of the device such that the intersection of the teeth with the handle of the device form oblique angles of from about 40° to about 50° relative to the longitudinal plane.

13. (original) The razor cleaning device, according to claim 8, wherein some portion of an absorbent material is attached to the handle of the device.

Claims 14 and 15 (canceled)

16. (original) The razor cleaning device, according to claim 8, wherein the brush and teeth are located on the same end of the handle.

17. (previously presented) A razor cleaning device comprising a handle to which are attached a brush and at least two sets of three parallel teeth of decreasing lengths, such that, when vertically aligned, at least one of the sets of teeth are arranged with the longest tooth on the top and shortest tooth on the bottom.

18. (previously presented) The razor cleaning device, according to claim 17, wherein the at least two sets of parallel teeth project from the handle of the device, such that the intersection of at least one of the sets of teeth with the handle of the device form oblique angles of from about 1° to about 90°.

19. (previously presented) The razor cleaning device, according to claim 17, wherein the at least two sets of parallel teeth project from the handle of the device, such that the intersection of at least one of the sets of teeth with the handle of the device form oblique angles of from about 20° to about 70°.

20. (previously presented) The razor cleaning device, according to claim 17, wherein the at least two sets of parallel teeth project from the handle of the device, such that the intersection of at

least one of the sets of teeth with the handle of the device form oblique angles of from about 30° to about 60°.

21. (previously presented) The razor cleaning device, according to claim 17, wherein the at least two sets of parallel teeth project from the handle of the device, such that the intersection of at least one of the sets of teeth with the handle of the device form oblique angles of from about 40° to about 50°.

22. (original) The razor cleaning device, according to claim 17, wherein some portion of an absorbent material is attached to the handle of the device.

Claims 23-46 (canceled).

47. (previously presented) A razor cleaning device comprising a handle to which are attached a brush and at least two sets of three parallel teeth of decreasing lengths such that, when vertically aligned, at least one of the sets of teeth is arranged with the longest tooth at the top and shortest tooth at the bottom, and at least one other set of teeth is arranged with the shortest tooth at the top and the longest tooth at the bottom.

48. (previously presented) The razor cleaning device, according to claim 47, wherein the teeth of at least one set of parallel teeth project from the handle at an oblique angle from about 1° to about 90° in the direction of the largest tooth.

49. (previously presented) The razor cleaning device, according to claim 47, wherein the teeth of at least one set of parallel teeth project from the handle at an oblique angle from about 20° to about 70° in the direction of the largest tooth.

50. (previously presented) The razor cleaning device, according to claim 47, wherein the teeth of at least one set of parallel teeth project from the handle at an oblique angle from about 30° to about 60° in the direction of the largest tooth.

51.(previously presented) The razor cleaning device, according to claim 47, wherein the teeth of at least one set of parallel teeth project from the handle at an oblique angle from about 40° to about 50° in the direction of the largest tooth.
